INTEGRATED POWER FUNCTIONS

600V/20A low-loss CSTBT™ inverter bridge with N-side three-phase output DC-to-AC power conversion

INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS

- For upper-leg IGBTs : Drive circuit, High voltage high-speed level shifting, Control supply under-voltage (UV) protection.
- For lower-leg IGBTs : Drive circuit, Control supply under-voltage protection (UV), Short circuit protection (SC).
- Fault signaling : Corresponding to an SC fault (Lower-leg IGBT) or a UV fault (Lower-side supply).
- Input interface : 3, 5V line (High Active)
- UL Approved : Yellow Card No. E80276

APPLICATION

AC100V~200V three-phase inverter drive for small power motor control.

THERMAL RESISTANCE

Symbol	Parameter	Condition	Limits			Unit
			Min.	Typ.	Max.	
Rth(j-c)Q	Junction to case thermal resistance (Note 2)	Inverter IGBT part (per 1/6 module)	—	—	1.3	°C/W
Rth(j-c)F		Inverter FWD part (per 1/6 module)	—	—	3.0	°C/W

Note 2 : Grease with good thermal conductivity should be applied evenly with about +100µm~+200µm on the contacting surface of DIP-IPM and heat-sink.

The contacting thermal resistance between DIP-IPM case and heat sink (Rth(c-f)) is determined by the thickness and the thermal conductivity of the applied grease. For reference, Rth(c-f) (per 1/6 module) is about 0.3°C/W when the grease thickness is 20µm and the thermal conductivity is 1.0W/m·k

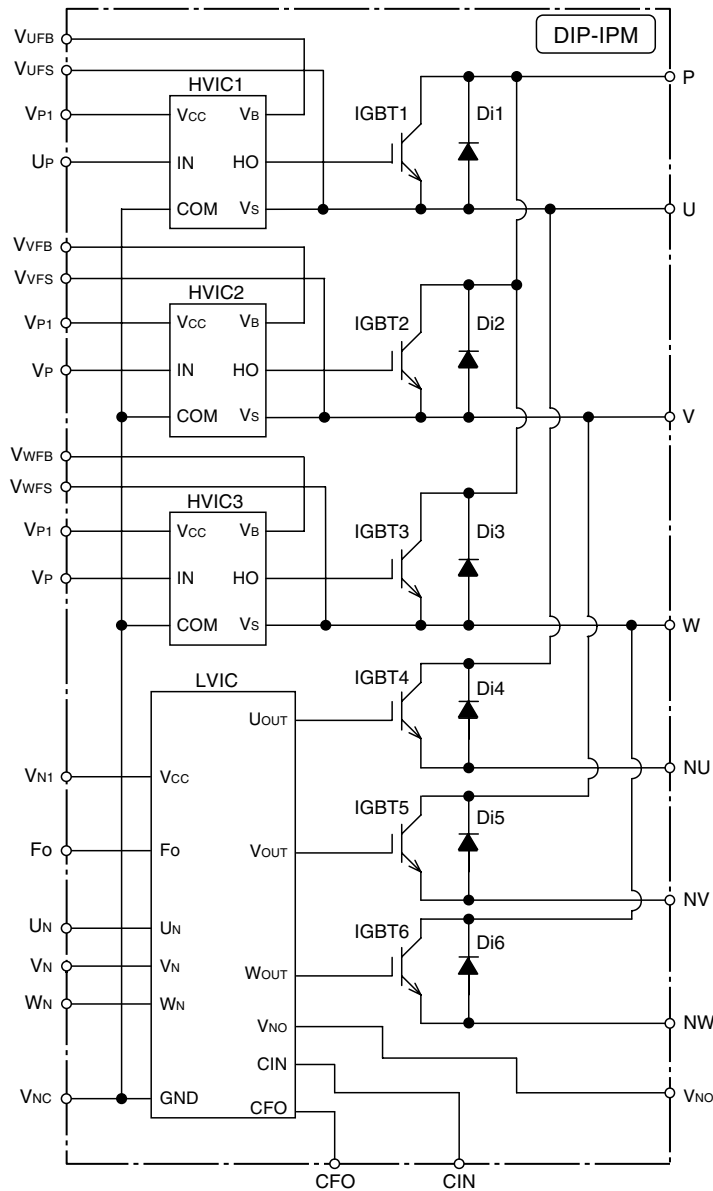

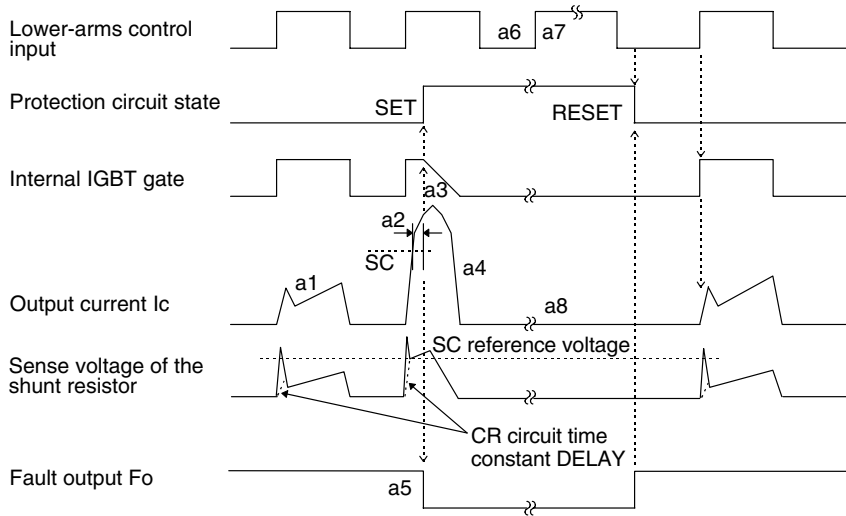

Fig. 4 TIMING CHARTS OF THE DIP-IPM PROTECTIVE FUNCTIONS

[A] Short-Circuit Protection (Lower-arms only with the external shunt resistor and CR filter)

- a1. Normal operation : IGBT ON and carrying current.
- a2. Short circuit current detection (SC trigger).
- a3. IGBT gate hard interruption.
- a4. IGBT turns OFF.
- a5. FO timer operation starts : The pulse width of the FO signal is set by the external capacitor CFO.
- a6. Input "L" : IGBT OFF.
- a7. Input "H"
- a8. IGBT OFF state in spite of input "H".

[B] Under-Voltage Protection (Lower-arm, UVd)

- b1. Control supply voltage rising : After the voltage level reaches UVDr, the circuits start to operate when next input is applied.
- b2. Normal operation : IGBT ON and carrying current.
- b3. Under voltage trip (UVDt).
- b4. IGBT turns OFF in spite of control input condition.
- b5. FO operation starts.
- b6. Under voltage reset (UVDr).
- b7. Normal operation : IGBT ON and carrying current.

[C] Under-Voltage Protection (Upper-arm, UVDB)

- c1. Control supply voltage rises : After the voltage level reaches UVDBr, the circuits start to operate.
- c2. Protection circuit state reset : IGBT ON and carrying current.
- c3. Normal operation : IGBT ON and carrying current.
- c4. Under-voltage trip (UVDBt).
- c5. IGBT OFF inspite of control input condition, but there is no Fo signal output.
- c6. Under-voltage reset (UVDBr).
- c7. Normal operation : IGBT ON and carrying current.

Fig. 5 RECOMMENDED MCU I/O INTERFACE CIRCUIT

Note : RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The DIP-IPM input signal section integrates a 2.5kΩ(min) pull-down resistor. Therefore, when using an external filtering resistor, care must be taken to satisfy the turn-on threshold voltage requirement.

Fig. 6 RECOMMENDED WIRING AROUND THE SHUNT RESISTOR

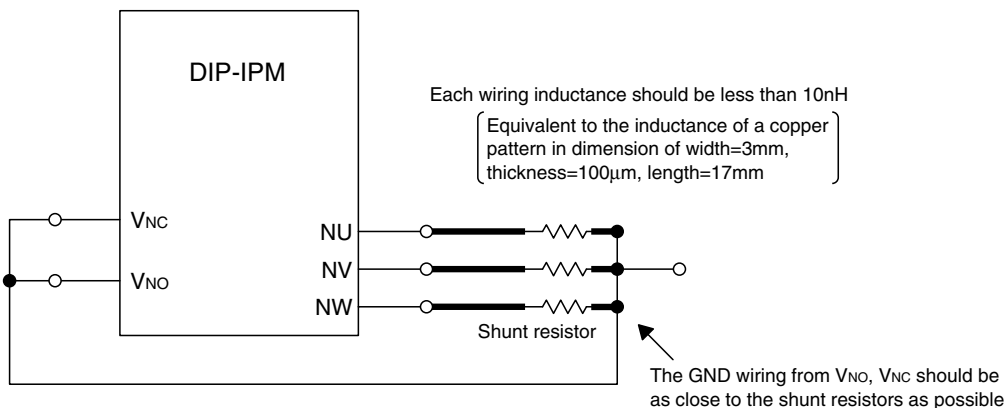

Fig. 7 TYPICAL DIP-IPM APPLICATION CIRCUIT EXAMPLE

C1: Tight tolerance temp-compensated electrolytic type C2,C3: 0.22~2μF R-category ceramic capacitor for noise filtering

- Note 1** : Input drive is High-active type. There is a 2.5kΩ(Min.) pull-down resistor integrated in the IC input circuit. To prevent malfunction, the wiring of each input should be as short as possible. When using RC coupling circuit, make sure the input signal level meet the turn-on and turn-off threshold voltage.
- 2** : Thanks to HVIC inside the module, direct coupling to MCU without any opto-coupler or transformer isolation is possible.
- 3** : Fo output is open drain type. It should be pulled up to the positive side of a 5V power supply by a resistor of about 10kΩ.
Fo output pulse width is determined by the external capacitor (CFO) between CFO and VNC terminals (e.g CFO = 22nF → tFO = 1.8ms (typ.))
- 4** : To prevent erroneous protection, the wiring of A, B should be as short as possible.
- 5** : The time constant R1C5 of the protection circuit should be selected in the range of 1.5-2μs. SC interrupting time might vary with the wiring pattern. Tight tolerance, temp-compensated type is recommended for R1, C5.
- 6** : All capacitors should be mounted as close to the terminals of the DIP-IPM as possible. (C1: good temperature, frequency characteristic electrolytic type, and C2, C3: good temperature, frequency and DC bias characteristic ceramic type are recommended.)
- 7** : To prevent surge destruction, the wiring between the smoothing capacitor and the P, N1 terminals should be as short as possible. Generally a 0.1-0.22μF snubber between the P-N1 terminals is recommended.
- 8** : It is recommended to insert a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction.
- 9** : If control GND is connected to power GND by broad pattern, it may cause malfunction by power GND fluctuation. It is recommended to connect control GND and power GND at only a point.
- 10** : The reference voltage Vref of comparator should be set up the same rating of short circuit trip level (Vsc(ref): min.0.43V to max.0.53V).
- 11** : OR logic output high level should exceed the maximum short circuit trip level (Vsc(ref): max.0.53V).
